XML

XML & HTML

The goal of these slides is to give you a **crash introduction to XML and HTML** so you can get a good grasp of those formats for the following lectures

Datasets

You'll have some sort of (raw) data to work with
tabular

non-tabular

Motivation

Two main limitations of field-delimited files

- In plain text formats there is no information to describe the location of the data values

- There is no recognizable label for each data value within the file

- Serious limitations to store data with hierarchical structure

Hierarchical data

Hierarchical data

Field-delimited files have limitations with hierarchical data

```
                John      33   male
                Julia     32   female
  John   Julia  Jack       6   male
  John   Julia  Jill       4   female
  John   Julia  John jnr   2   male
                David     45   male
                Debbie    42   female
  David  Debbie Donald    16   male
  David  Debbie Dianne    12   female
```

XML format

XML advantages

- XML is a storage format that is still based on plain text
- In XML formats every single value is distinctly labeled
- Moreover, every single value is self-described
- The information is organized in a much more sophisticated manner

Hierarchical data

An example of hierarchical data in XML

```xml
<family>
  <parent gender="male" name="John" age="33" />
  <parent gender="female" name="Julia" age="32" />
  <child gender="male" name="Jack" age="6" />
  <child gender="female" name="Jill" age="4" />
  <child gender="male" name="John jnr" age="2" />
</family>
<family>
  <parent gender="male" name="David" age="45" />
  <parent gender="female" name="Debbie" age="42" />
  <child gender="male" name="Donald" age="16" />
  <child gender="female" name="Dianne" age="12" />
</family>
```

XML and HTML

Why should you care about XML and HTML?

- Large amounts of data and information are stored, shared and distributed using HTML and XML-dialects

- They are widely adopted and used in many applications

- Working with data from the Web means dealing with HTML

XML

eXtensible Markup Language

Some Definitions

"XML is a markup language that defines a set of rules for encoding documents in a format that is both human-readable and machine-readable"

http://en.wikipedia.org/wiki/XML

"XML is a data description language used for describing data"

Paul Murrell
Introduction to Data Technologies

Some Definitions

"XML is a very general structure with which we can define any number of new formats to represent arbitrary data"

"XML is a standard for the semantic, hierarchical representation of data"

Deb Nolan & Duncan Temple Lang

XML and Web Technologies for Data Sciences with R

About XML

XML

XML stands for **eXtensible Markup Language**

Broadly speaking ...

XML provides a flexible framework to create formats for describing and representing data

Markup

A **markup** is a sequence of characters or other symbols inserted at certain places in a document to indicate either:

- how the content should be displayed when printed or in screen
- describe the document's structure

Markup Language

A markup language is a system for **annotating** (i.e. *marking*) a document in a way that the content is distinguished from its representation (eg LaTeX, PostScript, HTML, SVG)

LaTeX example

```
\documentclass{article}
\usepackage{graphicx}

\begin{document}

\title{Introduction to XML}
\author{First Last}
\maketitle

\section{Introduction}
Here is the text of your introduction.

\begin{equation}
    \label{simple_equation}
    \alpha = \sqrt{ \beta }
\end{equation}

\subsection{Subsection Heading Here}
Write your subsection text here.

\begin{figure}
    \centering
    \includegraphics[width=3.0in]{myfigure}
    \caption{Simulation Results}
    \label{simulationfigure}
\end{figure}

\end{document}
```

Markups

XML Markups

In XML (as well as in HTML) the marks (aka *tags*) are defined using angle brackets: `<>`

```
<mark>Text marked with special tag</mark>
```

Extensible

Extensible?

The concept of *extensibility* means that we can define our own marks, the order in which they occur, and how they should be processed. For example:

- `<my_mark>`
- `<awesome>`
- `<boring>`
- `<cool>`

About XML

XML is NOT

- a programming language

- a network transfer protocol

- a database

About XML

XML is

- more than a markup language

- a generic language that provides structure and syntax for representing any type of information

- a meta-language: it allows us to create or define other languages

XML Applications

Some XML dialects

- **KML** (*Keyhole Markup Language*) for describing geo-spatial information used in Google Earth, Google Maps, Google Sky

- **SVG** (*Scalable Vector Graphics*) for visual graphical displays of two-dimensional graphics with support for interactivity and animation

- **PMML** (*Predictive Model Markup Language*) for describing and exchanging models produced by data mining and machine learning algorithms

Keyhole Markup Language example

```xml
<?xml version="1.0" encoding="UTF-8"?>
<kml xmlns="http://www.opengis.net/kml/2.2">
<Document>
<Placemark>
  <name>New York City</name>
  <description>New York City</description>
  <Point>
    <coordinates>-74.006393,40.714172,0</coordinates>
  </Point>
</Placemark>
</Document>
</kml>
```

Scalable Vector Graphics example

```
<svg width="100" height="100">
  <circle cx="50" cy="50" r="40" stroke="green" stroke-width="4" />
</svg>

<svg width="400" height="110">
  <rect width="300" height="100" style="fill:rgb(0,0,255)" />
</svg>
```

Minimalist Example

XML Example

Ultra Simple XML

```
<movie>
  Good Will Hunting
</movie>
```

XML Example

Ultra Simple XML

```
<movie>
  Good Will Hunting
</movie>
```

- one single element *movie*
- start-tag: `<movie>`
- end-tag: `</movie>`
- content: `Good Will Hunting`

XML Example

Ultra Simple XML

```
<movie mins="126" lang="en">
  Good Will Hunting
</movie>
```

- ▶ xml elements can have **attributes**
- ▶ attributes: mins (minutes) and lang (language)
- ▶ attributes are *attached* to the element's start tag
- ▶ attribute values **must be quoted!**

XML Example

Minimalist XML

```
<movie mins="126" lang="en">
  <title>Good Will Hunting</title>
  <director>Gus Van Sant</director>
  <year>1998</year>
  <genre>drama</genre>
</movie>
```

- an xml element may contain other elements
- *movie* contains several elements: *title*, *director*, *year*, *genre*

XML Example

Simple XML

```
<movie mins="126" lang="en">
  <title>Good Will Hunting</title>
  <director>
    <first_name>Gus</first_name>
    <last_name>Van Sant</last_name>
  </director>
  <year>1998</year>
  <genre>drama</genre>
</movie>
```
- Now *director* has two child elements: *first_name* and *last_name*

XML Hierarchy Structure

## Conceptual XML

```
<Root>
  <child_1>...</child_1>
  <child_2>...</child_2>
    <subchild>...</subchild>
  <child_3>...</child_3>
</Root>
```

- An XML document can be represented with a **tree structure**
- An XML document must have **one single Root** element
- The Root may contain child elements
- A child element may contain subchild elements

```
movie
mins='126' lang='en'
```
Root element

children

```
title
```
```
director
```
```
year
```
```
genre
```

Good Will Hunting

subchildren

```
first_name
```
```
last_name
```

Gus

Van Sant

1998

drama

Well-Formedness

Well-formed XML

We say that an XML document is **well-formed** when it obeys the basic syntax rules of XML. Some of those rules are:

- one root element containing the rest of elements
- properly nested elements
- self-closing tags
- attributes appear in start-tags of elements
- attribute values must be quoted
- element names and attribute names are case sensitive

Well-Formedness

```
<movie mins="126" lang="en">
  <title>Good Will Hunting</title>
  <director>
    <first_name>Gus</first_name>
    <last_name>Van Sant</last_name>
  </director>
  <year>1998</year>
  <genre>drama</genre>
</movie>
```

Well-Formedness

Importance of Well-formed XML

Not well-formed XML documents produce potentially fatal errors or warnings when parsed.

Documents may be well-formed but not valid. Well-formed just guarantees that the document meets the basic XML structure, not that the content is valid.

Additional XML Elements

```xml
<?xml version="1.0"? encoding="UTF-8" ?>
<![CDATA[ a > 5 & b < 10 ]]>
<?GS print(format = TRUE)>
<!DOCTYPE Movie>
<!-- This is a commet -->
<movie mins="126" lang="en">
  <title>Good Will Hunting</title>
  <director>
    <first_name>Gus</first_name>
    <last_name>Van Sant</last_name>
  </director>
  <year>1998</year>
  <genre>drama</genre>
</movie>
```

Additional Optional XML Elements

Markup	Description
`<?xml >`	XML Declaration
	identifies content as an XML document
`<?PI >`	Processing Instruction
	processing instructions passed to application PI
`<!DOCTYPE >`	Document-type Declaration
	defines the structure of an XML document
`<![CDATA[ ]]>`	CDATA Character Data
	anything inside a CDATA is ignored by the parser
`<!-- -->`	Comment
	for writing comments

DTD

Document-Type Declaration

The Document-type Declaration identifies the **type** of the
document. The *type* indicates the structure of a **valid**
document:

- what elements are allowed to be present
- how elements can be combined
- how elements must be ordered

Basically, the DTD specifies what the format allows to do.

Wrapping Up

About XML

About XML

- designed to store and transfer data
- designed to be self-descriptive
- tags are not predefined and can be extended

Characteristics of XML

XML is

- a generic language that provides structure and syntax for many markup dialects
- is a syntax or format for defining markup languages
- a standard for the semantic, hierarchical representation of data
- provides a general approach for representing all types of information dialects

XML document example

Simple XML

```xml
<?xml version="1.0"?>
<!DOCTYPE movies>
<movie mins="126" lang="en">
  <!-- this is a comment -->
  <title>Good Will Hunting</title>
  <director>
    <first_name>Gus</first_name>
    <last_name>Van Sant</last_name>
  </director>
  <year>1998</year>
  <genre>drama</genre>
</movie>
```

XML Tree Structure

Each Node can have:
- a Name
- any number of attributes
- optional content
- other nested elements

Traversing the tree
There's a **unique** path from the root node to any given node

HTML

HTML

About HTML

- HyperText Markup Language
- standard markup language used to create web pages
- HTML describes the structure of a website semantically along with cues for presentation
- Web browsers can read HTML files and render them into visible or audible web pages

Hello World example

```html
<!DOCTYPE html>
<html>
  <head>
    <title>This is a title</title>
  </head>
  <body>
    <p>Hello world!</p>
  </body>
</html>
```

HTML

- ▶ Open a new text file
- ▶ Add osme HTML content (e.g. hello world example)
- ▶ Save your file with extension `.html`
- ▶ Click on your html file
- ▶ Should be displayed in your browser

Header Element

Header of the HTML document: is declared with the tag
<head>...</head>

```
<head>
  <title>The Title</title>
</head>
```

Headings

HTML headings are defined with the `<h1>`, `<h2>`, ... `<h6>` tags:

```
<h1>Heading level 1</h1>
<h2>Heading level 2</h2>
<h3>Heading level 3</h3>
<h4>Heading level 4</h4>
<h5>Heading level 5</h5>
<h6>Heading level 6</h6>
```

Paragraphs

Paragraphs are defined with the <p> tag:

```
<p>This is the first paragraph</p>

<p>
  This is the second paragraph.
  The quick brown fox jumps over the lazy dog.
</p>
```

Links and comments

Links require the anchor tag `<a>` and the attribute `href=`

```
<a href="https://www.wikipedia.org/">A link to Wikipedia!</a>
```

Comments:

```
<!-- This is a comment -->

<!--
  This is also a comment
-->
```

Images

Images are included with the `<img>` tag and the attribtue `src=`:

```
<img src="image.gif">
```

Image with a link:

```
<a href="http://example.org">
  <img src="image.gif" alt="descriptive text">
</a>
```

HTML Example

```html
<!DOCTYPE html>
<html>
  <head>
    <title>This is a title</title>
  </head>
  <!-- this is a commetn -->
  <body>
    <h1>Heading level 1</h1>
    <h2>Heading level 2</h2>
    <h3>Heading level 3</h3>
    <h4>Heading level 4</h4>
    <h5>Heading level 5</h5>
    <h6>Heading level 6</h6>

    <p>Hello world!</p>
    <img src="http://www.r-statistics.com/wp-content/uploads/2013

    <a href="https://www.r-project.org/">This is a link</a>
  </body>
</html>
```
